

Odell

Software developer — automation, integration and reverse engineering

odellgm11012001@gmail.com · t.me/odell0111 · github.com/odell0111 · linkedin.com/in/odell0111 · instagram.com/odell.dev

PROFILE

Self-taught developer since 2018. I build automation, integrations and desktop tools. I work mainly in Python and C#, with C and C++ where the problem calls for them. My projects tend to be tools: something that automates a process, packages a build, or reaches data that isn't exposed cleanly. That work sits close to the network — TLS and certificate chains, SSH, proxy rotation, authenticated sessions — so I read the protocol underneath before I trust it.

Most of my client work is private and cannot be published. The projects below are the part that is.

I care more about understanding a system than about shipping quickly on top of one I don't understand.

PROJECTS

Account Manager — account and password manager

Android and Windows · 2023–2025 · Apache-2.0

Desktop and mobile application that keeps accounts and passwords in one place.

- **Neither build connects to the internet.** There is no network traffic to intercept and no server that can leak.
- Built around multiple account types and password import from file.
- Fully bilingual interface, English and Spanish.
- **449 downloads** of the release APK (GitHub, September 2026).
- Source withheld deliberately, so the app can't be forked into insecure builds that put users' credentials at risk.

Custom GUI SFX — self-extracting archive builder for Windows

C#/.NET 6/WPF · 2023–2025

Desktop tool that packages an archive, custom info, links and images into a single self-extracting `.exe` that runs on a machine with no unzip utility installed.

- **MVVM** architecture over .NET 6 and WPF.
- The finished executable has to stay under 4 GB. The limit is in the Win64 format itself: the in-memory image is capped at 2 GB because AMD64 relative addressing keeps its offsets in a dword, and everything merged onto the binary pushes the file toward that ceiling. The constraint applies to the output binary, not the archive going in.
- **334 downloads** of the published builds (GitHub, September 2026).

Turnstile Solver — challenge-solving server

Python · 2025 · GPL-3.0

Async server that solves Cloudflare Turnstile challenges in a real browser and returns the token over a local REST endpoint.

- Proxy handling is first-class: global, via environment, or rotated per browser context.
- **pytest** suite and **Docker** deployment.
- **52 stars and 15 forks** on GitHub.

Image in Terminal — Python package published on PyPI

Python · 2023–2025 · MIT

Package and CLI that renders images as coloured Unicode text in the terminal.

- Takes local files, HTTP/HTTPS URLs, or a whole directory.
- Two tuning thresholds decide which pixels get inverted, so images stay legible against either a light or a dark terminal.

- Published on **PyPI** as `image-in-terminal`.

Process automation — private work

Python · 2024–2025

Unattended automation of workflows at scale: authenticated session management, request scheduling, concurrency, and integration with undocumented APIs.

- Systems that keep running unwatched: session handling, scheduling, and retry logic that survives the failure cases.
- It taught me more about identity handling, concurrency and anti-abuse systems than anything I have built since.
- Source not published.

TECHNICAL SKILLS

Languages	Python, C#, C++, C, Kotlin, JavaScript, Java
Frameworks & libraries	Flask, FastAPI, Django, SQLAlchemy, Quart · Playwright, Selenium, Scrapy, BeautifulSoup, requests, aiohttp/httpx · NumPy, Pandas, Matplotlib, OpenCV, Pillow · Rich, pytest
Databases	PostgreSQL, SQL
Tools	Git (advanced), GitHub, Docker, Docker Compose, Linux, Visual Studio, PyPI, setuptools, Odoo.sh
Security	Network and protocol analysis · TLS/HTTPS and certificate chains · SSH keys and tunnelling · wireless (WiFi) security · proxy handling and authenticated sessions
Areas	Reverse engineering and protocol analysis · automation and systems integration · desktop development (WPF / .NET) · Android development (Kotlin, Jetpack Compose) · full-stack web development

EDUCATION

Self-taught since 2018. No formal computer science qualification, but a structured education rather than an incidental one: programming courses and technical books, worked through properly and then applied. The theory came first — memory management, protocol analysis, system architecture — and taking apart software that already worked came after, to check I had actually understood it.

Currently learning — Odoo. Modular architecture built on Python, PostgreSQL and XML, with Odoo.sh deployments over Git and GitHub. No production experience yet.

LANGUAGES

- **Spanish** — native.
- **English** — full professional proficiency, written and spoken. I read code and write technical documentation without friction, and speak fluently enough to sound like a native.
